

Mental Health Access

Chris B's Squad
@DBRIGHT*81 on Github

Description

The goal of this project is to provide users with information to mental healthcare access with the app's focus being on those whose first language isn't English.

Features

- l18n
- Password encryption
- Uses MySQL database to store info

Planning - User Stories

The user is able to create an account to view mental health provider info.

The use can view the site in Spanish. More languages to be added in the future.

The provider can set options for those who may not have insurance.

Planning - Database

Right now the tables in our database are provider, user and provider languages.

The user table stores the information from the client side(name, contact info,etc). The provider table holds the same info, but also a spot for for the providers preferred language.

The provider languages column holds the language that the provider chooses to communicate in. Spanish is the only one available right now, but more will be added in the future

Technology Stack

Language: Java

Framework: Thymeleaf

Template engine: HTML/CSS

Database engine: MySQL

Bootstrap

Demo

What I/We Learned

- I started becoming more comfortable with thymeleaf and it's properties
- I learned how to get information from controllers to a template to create dashboard views for user and provider profiles.
- The next step is to add code that will allow the user to add the providers they choose to their profile.

What's Next

My next step is to use thymeleaf to complete the views for the user dashboard and provider information to be more uniform with the rest of the app. I also would like to create a view with information to basic human needs and services.
